ARRANGEMENT OF THE CATALOGUE.

THE editor of the Catalogue has pursued that method which appeared to insure the greatest simplicity of arrangement. The division into classes of all the objects in the Exhibition was accomplished before the work of preparing the Catalogue was commenced. The exhibitors in each class are numbered without any regard to the original number, or, in other words, to the number of the space-grant. This should be distinctly observed; 'since many exhibitors suppose that they will be represented by that number in the Catalogue and the building. The numbers affixed to the articles will correspond with the class numbers in this Catalogue, and no others will be employed.

The order in which the countries are arranged in the Catalogue has been determined by the succession of the countries themselves in the building. The visitor will find, upon other pages, plans of the two floors, with references, which will enable him to find the different positions indicated for the various countries and classes. In addition to this, the different countries will be indicated in the building by conspicuous signs; and every court and class will also be similarly indicated. To use the Catalogue, therefore, to the best advantage, the visitor should pursue, on passing through the building, the order in which it presents the countries. As an object meets his eye, he will notice its class and serial numbers, and reference to the following

pages, will at once put him in possession of all the information concerning the object which such a Catalogue as this can embrace.

The disadvantages under which the Catalogue has been prepared, render it vain to hope that it is free from great imperfections and errors. Exhibitors and others interested, therefore, who may detect omissions, or mistakes of any kind, are particularly requested to offer corrections immediately to MESSRS. PUTNAM & Co., at the Catalogue office, in the Exhibition building

DESCRIPTION OF THE BUILDING.

THE following concise and graphic description of the building is copied from the first number of the "Illustrated Record of the Exhibition," published by Messrs. Geo. P. Putnam & Co.:

Reservoir Square, on which the building of the New-York Industrial Exhibition is erected, lies in the north-western part of the city, four miles distant from the Battery, and three and a quarter from the City Hall, between the Sixth Avenue and the Croton Distributing Reservoir, whose massive walls overshadow its eastern side. The distance from the Reservoir to the Avenue is 445 feet; and the width from Fortieth-street in the south, to Forty-second street, its northern limit, is 455 feet. This space is almost entirely occupied by the building. The shape of the ground is unfavorable for architectural purposes; and, aside from the facilities of access afforded by the Avenue railways and numerous lines of stages, there is nothing to recommend this locality, while the solid and imposing strength of the Reservoir presents an inharmonious contrast with that light and graceful structure which we now proceed to describe.

The appearance of the building, and the materials employed to construct it, show its relationship to the Crystal Palace of Hyde Park. Like that, its framework is a system of iron columns and girders; glass excludes the dull and heavy walls of masonry used in ordinary structures, and, with the slender proportions of the framing, gives the edifice the light and airy appearance so well expressed by its popular name. The resemblance which we have spoken of is only a general one; the ground plan, the relative proportion of each of the materials employed, and the details of construction, are quite different from its English prototype, and give it an architectural effect and character of its own.

The general idea of the New-York building is a Greek cross, surmounted by a dome at the intersection. The length of each diameter of the cross is 365 feet and 5 inches, and the width of the arms is 149 feet and 5 inches. This does not include the three entrance halls, projecting towards Sixth Avenue, Fortieth, and Forty-second streets, which are each 27 feet wide, and approached by flights of steps. By referring to the engravings [on pages 22 and 23 of this catalogue], it will be seen that, although the edifice is cruciform, the outline of the ground plan is nearly a regular octagon, whose diameter is the same as that of the arms of the cross. This form has been given to it by ingeniously filling up the triangular intervals between the arms of the cross with a lean-to of only one story, or twenty-four feet in height. The adoption of this device was necessary in order to provide space for the exhibition; it being impossible within the narrow limits of the site to enlarge the dimensions of the cross in the usual way; and while this substantial advantage is gained, it is productive of only a slight architectural defect in diminishing the prospective of the interior.

The arrangement of the columns is represented upon the diagrams. It will be seen that they divide the interior into two principal avenues or naves, each 41 feet and 5 inches wide, with aisles 54 feet wide upon either side. The intersection of the naves leaves in the centre a free octagonal space 100 feet in diameter. The columns still further subdivide the aisles and the triangular intervals between the arms of the cross, into square and half-square compart-

ments of 27 feet on the side. The aisles are covered with galleries of their own width, and they are united to each other by broad connections at the extremities of the naves. The naves are carried above the roofs of the galleries to admit light, and are spanned by 16 semicircular arches of cast-iron, which are 40 feet and 9 inches in diameter, and placed at a distance of 27 feet from each other.

The number of cast-iron columns upon the ground floor is 190. They are 21 feet high above the floor, octagonal, and 8 inches in diameter; the thickness of the sides varies from half an inch to one inch. The cast-iron girders, 3 feet wide, of which the longest are 26 feet and 4 inches, and those of wrought iron, 40 feet and 9 inches long, are indicated by the dotted lines. The first tier of girders sustain the floors of the galleries, and brace the structure in all directions. They are united to the columns by connecting pieces 3 feet 4 inches high, which have the same octagonal shape as the columns, and flanges and lugs to be bolted together. The number of girders in the first tier is 252. The second story contains 148 columns 17 feet and 7 inches high, which rest on those below them, and have the same shape. They receive a second series of girders numbering 160, which support the roofs of the aisles. They also receive the semicircular arches of the naves. All the roofs are supported upon arches or upon girders, by means of wrought-iron inverted trusses, which receive the angle iron purlins of the rafters; the latter are made of strips of wood inclosed between iron sides. The roofs are uniformly constructed of boards, matched together and covered with tin.

The dome, noble and beautiful in its proportions, is the chief architectural feature of the building. Its diameter is 100 feet, and its height to the springing line is nearly 70 feet, and to the crown of the arch 123 feet. It is the largest, as well as almost the only dome hitherto erected in the United States. To our untravelled countrymen it may be an instructive example of the beauty and fine architectural effect of which this structure is capable, although its dimensions are trivial when compared with the majestic domes of the Pantheon or St. Peter's, or those other wonderful erections of classic and mediæval times when architecture was a passion, and united with religious enthusiasm to produce the triumphs of the Art. We have given upon a separate page, as a frontispiece of this number, an architectural section of the dome, which will give our readers a better idea of its structure than any description can do. A perspective view of the interior, which was promised by the architects for this number, will be published as soon as it is ready. The dome is supported by 24 columns, which rise beyond the second story, and to a height of 62 feet above the principal floor. The system of wrought-iron trusses which connects them together at the top, and is supported by them, forms two concentric polygons, each of 16 sides. They receive a cast-iron bed-plate, to which the cast-iron shoes for the ribs of the dome are bolted. The latter are 32 in number. They are constructed of two curves of double angle-iron, securely connected together by trellis-work. The requisite steadiness is secured by tie-rods, which brace them both vertically and horizontally. At the top, the ribs are bolted to a horizontal ring of wrought and cast-iron, which has a diameter of 20 feet in the clear, and is surmounted by the lantern. As in the other roofs of the building, the dome is cased with match deal and tin sheathing. Light is communicated to the interior through the lantern, and also in part from the sides, which are pierced for thirty-two ornamental windows. These are glazed with stained glass, representing the arms of the Union and of its several States, and form no inconsiderable part of the interior decoration.

The external walls of the building are constructed of cast-iron framing and panel-work, into which are inserted the sashes of the windows and the louvers

for ventilation. The glass is one-eighth of an inch thick, and was manufactured at the Jackson Glass Works, N. Y., and afterwards enamelled by Cooper & Belcher, of Camptown, N. J. The enamel, with which the whole of it is covered, is laid upon the glass with a brush, and after drying, is subjected to the intense heat of a kiln, by which the coating is vitrified, and rendered as durable as the glass itself. It produces an effect similar to that of ground glass, being translucent, but not transparent. The sun's rays, diffused by passing through it, yield an agreeable light, and are deprived of that intensity of heat and glare which belongs to them in this climate. In the absence of a similar precaution in the Crystal Palace of Hyde Park, whose roofs, as well as walls, were inclosed with transparent glass, it was found necessary to cover the interior of the building with canvas, to produce the required shade.

At each angle of the building there is an octagonal tower, 8 feet in diameter and 76 feet in height. These contain winding stairways, which lead to the galleries and roofs, and are intended for the use of the officers and employees of the Association. Twelve broad staircases, one on either side of each entrance, and four beneath the dome, connect the principal floor with the gallery. The latter are circular in part, and consists of two flights of steps, with two landing-places. The flooring of the galleries is made of closely-matched planks, while those forming the floor of the first story are separated by narrow intervals, in the same manner and for the same purpose as in the London building. Over each of the principal entrance halls, the galleries open upon balconies, which afford ample space for placing flowers, vases, and statues for decoration. Above the balconies, the ends of the naves are adorned with large fan-lights, corresponding to the semicircular arches within. On each side of the entrances there are ticket offices, and adjacent to them rooms are provided for the officers of the Association, telegraph, &c.

The rapid and unexpected increase of the applications of exhibitors, induced the Association to erect a large addition to the building already described. It consists of two parts, of one and two stories respectively, and occupies the entire space between the main building and the Reservoir. Its length is 451 feet and 5 inches, and its extreme width is 75 feet. It is designed for the reception of machinery in motion, the cabinets of mining and mineralogy, and the refreshment rooms with their necessary offices. The second story, which is nearly 450 feet long, 21 feet wide, and extends the whole length, is entirely devoted to the exhibition of pictures and statuary. It is lighted from a skylight, 419 feet long, and 8 feet and 6 inches wide.

The DECORATIONS of the building have been intrusted to HENRY GREENOUGH, Esq., of Cambridge, brother of the lamented sculptor of the same name. Mr. Greenough has made Art his study, and in its pursuit has resided long in Italy. As he has promised to unfold the general principles and detail of his present work in an essay, to be published in an early number of the RECORD, we will state at present only a few facts.

The leading idea in the plan of decoration has been to bring out the beautiful construction of the building—to decorate construction rather than to construct decoration. To do this, and at the same time to preserve a general harmony of effect, has given Mr. Greenough ample opportunity to display his knowledge of the resources of his art. The result is surprisingly beautiful.

The decoration was commenced only on the 27th of April, but as soon as the progress of the construction would permit. The colors employed on the exterior and interior are mixed in oil, the base being the white lead manufactured by the Belleville Co. The exterior presents the appearance of a building constructed of a light-colored bronze, of which all features purely ornamental are of gold.

The interior has a prevailing tone of buff, or rich cream-color, which is given to all the cast-iron constructive work. This color is relieved by a moderate and judicious use of the three positive colors, red, blue, and yellow, in their several tints of vermilion, garnet, sky blue and orange (certain parts of the ornamental work being gilt), to accord with the arrangement of colors employed in the decoration of the ceilings. The only exceptions to the use of oil colors are the ceiling of the American lean-to and the dome; these decorations are executed in tempera on canvas.

The effect of the interior of the dome (designed by Sr. Monte Lilla), is particularly splendid. The rays from a golden sun, at the centre, descend between the latticed ribs, and arabesques of white and blue, relieved by silver stars, surround the openings. We propose, hereafter, to furnish a page in chromo-lithography, which will illustrate in a much more satisfactory manner than can be accomplished by description, the arrangement and effect of the interior decoration. But, as already stated, a more extended account of the decorations, explaining the principles on which they are designed, and the objects in view, will appear in the report of the Superintendent of Decoration.

The building is supplied with gas and water in every part. The gas is designed for the use of the police in protecting the property by night, but is so arranged, that should it be deemed expedient to open the building in the evenings, there will be ample light. The water is accessible at numerous points, with conveniences for drinking, and also for the attachment of hose in case of fire.

The whole quantity of iron employed in the construction amounts to 1,800 tons; of which 300 tons are wrought, and 1,500 tons cast-iron. The quantity of glass is 15,000 panes, or 55,000 square feet. The quantity of wood used amounts to 750,000 feet, board measure.

To complete our explanation of the construction of the building, we recapitulate its principal dimensions, and annex a few references to the diagrams:—

HISTORICAL SKETCH OF THE RISE AND PROGRESS OF THE ASSOCIATION.

FROM THE "ILLUSTRATED RECORD OF THE EXHIBITION."

A BRIEF statement of the origin and progress of the Association for the Exhibition of the Industry of All Nations, will be an appropriate introduction to the first part of the RECORD. It is perhaps needless to say that the triumphant success of the London Exhibition gave birth and force to the idea of this. Simultaneously, almost, it was proposed to repeat the grand experiment in Dublin, in France, and in the United States. Although America achieved some of the most signal and permanently valuable results which were brought to the knowledge of mankind by the Exhibition in Hyde Park; still there was probably no American who saw our contributions in London, that did not feel some regret that they were not a more just and equally sustained exponent of our resources, industry, and arts.

But stronger and more controlling than this sentiment, was the desire excited to afford the masses in America an opportunity to see the grand total of the world's industry, and the manifold productions and applications of the arts of design brought in one comparative view. It was seen, that while no motive but a proper regard for our own position in the great family of nations could have induced us, as a people, to send our industrial products to Europe, where we find a market only for our great staple raw materials, that the fact of our becoming more and more every day the great purchasers of the products of European skill and labor, expended, perhaps, upon our own products, would induce all the manufacturing states of the old world to embrace, eagerly, an opportunity to expose their products in the New-York Crystal Palace.

This conviction, strengthened by the sentiments before alluded to, led a few public-spirited citizens of the United States, early in 1852, to contemplate the organization of the effort whose results we see. It was not designed or desired to reproduce the London Exhibition, which, from the very nature of the case, must ever remain unexampled; but to draw forth such a representation of the world's industry and resources as would enable us to measure the strength and value of our own, while it indicated new aims for our enterprise and skill.

There is no humiliation in the acknowledgment, that America has more to gain from such a comparison than any other nation in Christendom—and we believe she is also more willing to avail herself of the suggestions it offers.

It was obvious in the outset, that numerous difficulties would embarrass the successful organization of an exhibition of industry in the United States,

which should at once be universal in its scope, and devoid of the imputation of local or sectional influence. These difficulties were inherent in the nature of our political institutions.

In England, the suggestion of Prince ALBERT to the Society of Arts was received with enthusiasm, and enlisted not only the cordial support of the Queen, but every member of a numerous and wealthy aristocracy joined his hand in setting forward the royal project. The government, however backward and lukewarm they might have been at first, could not resist an influence with which, as men, they were identified. Then the almost supreme power of the London journals came in to swell and direct the popular sentiment, and to make every Englishman feel that he had an immediate personal stake in the success—the triumphant and overwhelming success—of an enterprise to which the honor of his sovereign, and of the nation, stood pledged before all mankind.

Under the stimulus of such powerful motives, the universal intellect of the United-Kingdom organized itself in Councils, Committees, and Juries. Men whose names are identified with the halls of science, of literature, and of art, left their tripods, and were found heading the various corps of hard-working volunteers in considering or perfecting the several details of the colossal scheme. The rooms of the Royal, the Geological, the Geographical, the Ethnological, and the Statistical Societies, of the Institutions of Civil Engineers and Architects, of the Museum of Economic Geology—and even of the staid and conservative Universities, were for a time deserted to furnish men and mind for the emergency. In looking over the long catalogue of councilmen and chairmen, of commissioners, associates, and jurymen, whose names are connected with the administration of the London Exhibition, it is astonishing to see what an array of talent and learning was gathered to secure its success. Nor was this peculiar to Great Britain; but from all parts of the world, we find in its published lists men whose names are the guaranty of eminent success, not only in their own departments, but in whatever they may undertake. Such was the animus of the London Exhibition.

Compared with this royal espousal, and enormous personal influence brought to sustain and carry forward the exhibition of 1851, the simple machinery and resources of an association of private gentlemen, however enterprising, might seem utterly inadequate. Let the results decide. Such an association was formed, and stands committed to the successful prosecution of the plan. All the world has been invited to co-operate in sustaining the effort, and the appeal has met a response as cordial, as the design is liberal and catholic.

New-York was selected as the locality of the Exhibition, because of its great advantages as a commercial centre, and as the chief entrepôt of European goods. Had it been proposed to limit the Exhibition to the products of American industry, some place more central, as Washington, Philadelphia, or Cincinnati, might have been justly preferred, but in view of the foreign department of the scheme, New-York seemed the only place at all suited for the purpose.

The Municipal authorities of the city of New-York, on the 3d of January, 1852, moved by an enlightened regard for the prosperity of the city, and the interests of its inhabitants, granted a lease for five years of Reservoir Square, for this purpose, upon two conditions: one, that the building should be constructed of glass and iron, and the other, that no single entrance fee should exceed fifty cents.

The Legislature of the State of New-York, upon application, granted, on the 11th of March, 1852, the charter under which the ASSOCIATION FOR THE

EXHIBITION OF THE INDUSTRY OF ALL NATIONS has been organized and carried forward. The Act clothed the Directors with all the powers needed to carry out its plans, and the Legislature have since that time extended its privileges, so that it can issue stock to the amount of half a million dollars, in place of the original limitation to three hundred thousand dollars. The Board of Directors first met on the 17th of March, 1852, and organized by the election of THEODORE SEDGWICK, Esq., President, and WILLIAM WHETTEN, Esq., as Secretary. No time was lost in publishing and circulating a general statement of the objects of the enterprise. A call for subscriptions to the stock was met in due time, by about one hundred and fifty persons and firms coming forward to take up the first two hundred thousand dollars. This wide distribution of the interest in a large number of hands completely avoided the obnoxious charge, that the undertaking was a speculation designed for the benefit of a few.

The countenance and co-operation of the General Government was sought with a view to the introduction of foreign goods into the Exhibition duty free. And official assurances were given by Mr. MAXWELL, the Collector of the port of New-York, that the building of the Association would be made a bonded warehouse, thus entitling the Association to receive the goods free of duty, while on exhibition.

The influence of the General Government was also most cheerfully extended on behalf of the Association, through the kind offices of Mr. WEBSTER, then Secretary of State, who wrote to the representatives of the United States at the principal courts of Europe, stating to them his sense of the importance of the enterprise, and the numerous reasons why in his view they should give to the Association all the aid and support in their power.

The Ministers of foreign powers, resident in the United States, had previously responded, in terms of entire cordiality, to the general circular of the Association, which had been addressed to them, stating its plans, and soliciting the co-operation of European nations. They all expressed their convictions that their respective governments would look with favor upon the proposed exposition, and unite in sending to New-York their most valued and characteristic objects of industry.

The leading foreign newspapers also manifested a most friendly desire to sustain the success of the undertaking, and the records of the office contain the most abundant evidence of their zealous support; while the daily journals in foreign languages in the United States were prominent in lending their services to the cause.

The organization of the foreign relations of the Association was effected by the appointment of Mr. CHARLES BUSCHKE, of London, as its general agent, through whom all details have been arranged. This delicate and important trust, involving the greatest responsibility, required talents, knowledge, and experience, both of a commercial and of a diplomatic character. The Association was truly fortunate in finding these qualities combined in one person. Mr. BUSCHKE was the Austrian Commissioner at the London Exhibition of 1851, and through him the co-operation of the European manufacturers has been secured to an unexpected extent.

At a later period in the history of the enterprise, it was thought to be expedient to send out to Europe Col. G. W. HUGHES, of Maryland, to co-operate with Mr. BUSCHKE in carrying out the plans of the Association. This gentleman added to the weight of his official commission the influence of personal qualities, fitting him, in a remarkable manner, for his delicate task of soliciting or directing the countenance and support of European governments in favor of the objects of the New-York Exhibition. The result of his labors has been

the securing from various governments important contributions, which would otherwise have remained unknown in the UNITED STATES.

By midsummer of last year, the corps of Engineers and architects was organized by the appointment of Mr. C. E. DERMOLD as superintending Architect and Engineer; Mr. HORATIO ALLEN, consulting Engineer; and Mr. EDMUND HURRY, consulting Architect. To these gentlemen the construction of the building was confided, and by them it has been brought to its completion.

DIVISION INTO CLASSES.

All objects embraced in this Catalogue are separated into distinct classes, for the purpose of giving unity to the Exhibition, and to facilitate the adjustment of premiums and awards upon the final reports of the juries. With slight changes, the classification is the same as that adopted at the Great Exhibition in London, in 1851. A list of the classes is here subjoined:—

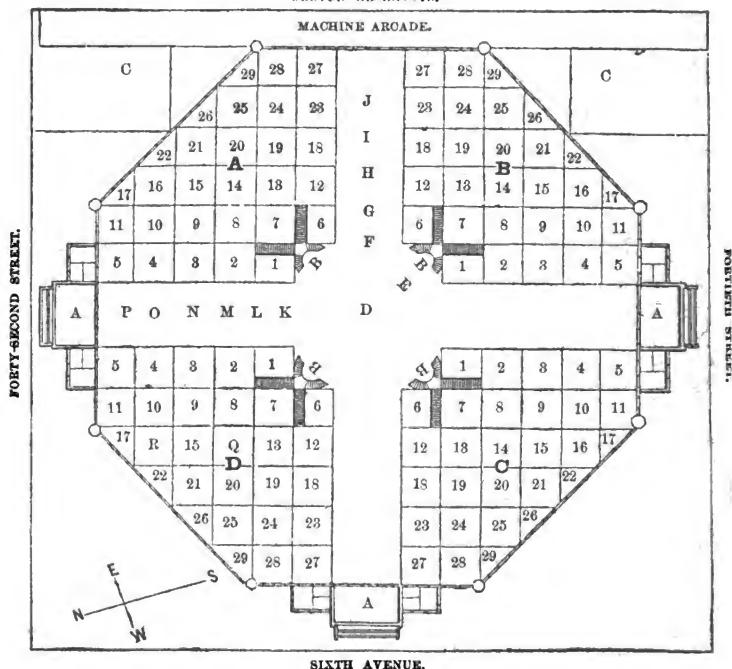

List of Classes into which articles are divided.

POSITION OF COUNTRIES IN THE BUILDING.

DIVISION A, on both floors, is occupied by the United States.

DIVISION B, on both floors, by Great Britain and Ireland.

DIVISION C, by Germany, France and Belgium.

DIVISION D, by Austria, Holland, Italy, British Possessions, Sweden and Norway, Denmark, Mexico, Turkey and Hayti.

Generally, the Courts in the Gallery are occupied by the same countries which occupy the corresponding Courts on the first floor. The exceptions to this are, that Switzerland occupies *only* Gallery space, over Holland, which has no space in the Gallery; and Germany extends over Belgium, which also has no space in the Gallery.

CATALOGUE.

CLASS 1.

MINERALS, MINING AND METALLURGY; GEOLOGICAL AND MINING SECTIONS AND PLANS.

THE Directors having appropriated space for this important department in the additional building now being erected, delay in the arrangement of the numerous contributions is unavoidable; and the preparation of any thing like a perfect catalogue being impossible, until the objects are arranged, it has been thought proper to omit this department altogether from the first edition of the official catalogue, and until such time as the cabinet is open to the public.
